

## Trussville Utilities Board

### Automated Meter Reading (AMR) Project

Over the next several months, Trussville Utilities will install automated meter reading (AMR) technology on the natural gas and /or water meters in your area. Natural gas meters will require the installation of a small radio transmitter on the meter which will not disrupt service (some locations may require the replacement of the natural gas meter). Water meters will be replaced with the new AMR equipped water meters. The service work will be completed by qualified UPA (Utility Partners of America) contractors or Trussville Utilities service personnel.

The implementation of the AMR technology yields several benefits. AMR technology will allow Trussville Utilities to remotely read meters and significantly reduce the need to access your property. The AMR technology also ensures accurate and consistent meter reads. Electronic reads are more accurate than manual reads, so the effects of human error are reduced. In addition, AMR technology includes the ability to detect meter tampering and theft of services.
